Assignment 6: GLMs (Linear Regressios, ANOVA, & t-tests)

Natasha Jacob

OVERVIEW

This exercise accompanies the lessons in Environmental Data Analytics on generalized linear models.

Directions

1. Change "Student Name" on line 3 (above) with your name.
2. Work through the steps, **creating code and output** that fulfill each instruction.
3. Be sure to **answer the questions** in this assignment document.
4. When you have completed the assignment, **Knit** the text and code into a single PDF file.
5. After Knitting, submit the completed exercise (PDF file) to the dropbox in Sakai. Add your last name into the file name (e.g., "Fay_A06_GLMs.Rmd") prior to submission.

The completed exercise is due on Monday, February 28 at 7:00 pm.

Set up your session

1. Set up your session. Check your working directory. Load the tidyverse, agricolae and other needed packages. Import the *raw* NTL-LTER raw data file for chemistry/physics (`NTL-LTER_Lake_ChemistryPhysics_Raw.csv`). Set date columns to date objects.
2. Build a ggplot theme and set it as your default theme.

```
#1 Setting the working directory and loading the required packages
getwd()
```

```
## [1] "/Users/admin/Desktop/ENV872_EDA/Environmental_Data_Analytics_2022"
```

```
library(tidyverse)
```

```
## -- Attaching packages --------------------------------------- tidyverse 1.3.1 --

## v ggplot2 3.3.5     v purrr   0.3.4
## v tibble  3.1.6     v dplyr   1.0.7
## v tidyr   1.1.4     v stringr 1.4.0
## v readr   2.1.1     v forcats 0.5.1

## -- Conflicts ------------------------------------------ tidyverse_conflicts() --
## x dplyr::filter() masks stats::filter()
## x dplyr::lag()    masks stats::lag()
```

```r
library(agricolae)
library(lubridate)
```

```
##
## Attaching package: 'lubridate'

## The following objects are masked from 'package:base':
##

```

```
##
## Attaching package: 'cowplot'

## The following object is masked from 'package:lubridate':
##
##     stamp
```

```r
# Reading in the dataset
NTL_raw <- read.csv("../Environmental_Data_Analytics_2022/Data/Raw/NTL-LTER_Lake_ChemistryPhysics_Raw.c
#Changing the date format and checking using the class function
NTL_raw$sampledate <- as.Date(NTL_raw$sampledate, format = "%m/%d/%Y")

class(NTL_raw$sampledate)
```

```
## [1] "Date"
```

```r
#2 Building a ggplot theme
mytheme <- theme_classic(base_size = 10) +
  theme(axis.text = element_text(color = "black"), legend.key.height = unit(0.5, 'cm'),
        legend.key.width = unit(0.5, 'cm'), legend.key.size = unit(0.5, 'cm'),
        legend.text = element_text(size=7),legend.title = element_text(size=10),
        legend.position = "top")
theme_set(mytheme)
```

Simple regression

Our first research question is: Does mean lake temperature recorded during July change with depth across all lakes?

3. State the null and alternative hypotheses for this question: > Answer: H0: Mean Lake temperature recorded during July does not change with depth across all lakes Ha: Mean Lake temperature recorded during July changes with depth across all lakes

4. Wrangle your NTL-LTER dataset with a pipe function so that the records meet the following criteria:

- Only dates in July.
- Only the columns: `lakename`, `year4`, `daynum`, `depth`, `temperature_C`

- Only complete cases (i.e., remove NAs)

5. Visualize the relationship among the two continuous variables with a scatter plot of temperature by depth. Add a smoothed line showing the linear model, and limit temperature values from 0 to 35 °C. Make this plot look pretty and easy to read.

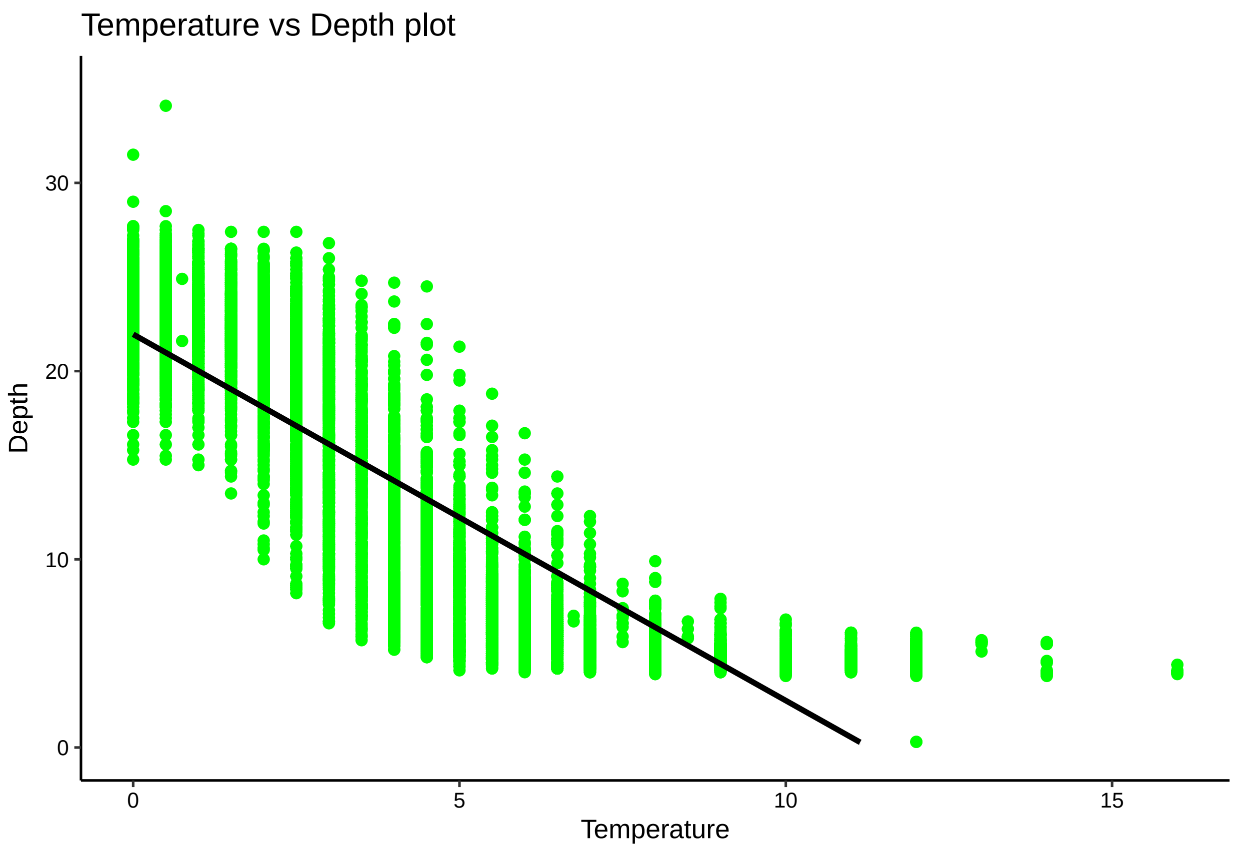
```
#4 Wrangling the NTL-LTER dataset using a pipe function
NTL_wrangled <-
  NTL_raw %>%
  mutate(Month = month(sampledate)) %>%
  filter(Month %in% c("7")) %>%
  select(lakename, year4, daynum, depth, temperature_C) %>%
  filter(!is.na(lakename) & !is.na(year4) & !is.na(daynum) & !is.na(depth) & !is.na(temperature_C))

#5 Visualizing the relationship between temperature and depth

TemperatureByDepth_Plot <- ggplot(NTL_wrangled,
                                  aes(x = depth, y = temperature_C)) +
  geom_point(color = "green") +
  geom_smooth(method = lm, color = "black") +
  ylim(0, 35) +
  ylab(expression("Depth")) +
  xlab(expression("Temperature")) +
  ggtitle("Temperature vs Depth plot") +
  mytheme
print(TemperatureByDepth_Plot)
```

```
## `geom_smooth()` using formula 'y ~ x'

## Warning: Removed 24 rows containing missing values (geom_smooth).
```



6. Interpret the figure. What does it suggest with regards to the response of temperature to depth? Do the distribution of points suggest about anything about the linearity of this trend?

   Answer: From the above plot, we can see that temperature decreases with depth. At the surface of the lake, higher temperatures can be observed and this decreases as depth increases.

7. Perform a linear regression to test the relationship and display the results

```
#7 Performing a linear regression
TempByDepthlm <- lm(data = NTL_wrangled, temperature_C ~ depth)
summary(TempByDepthlm)
```

```
##
## Call:
## lm(formula = temperature_C ~ depth, data = NTL_wrangled)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -9.5173 -3.0192  0.0633  2.9365 13.5834
##
## Coefficients:
##             Estimate Std. Error t value Pr(>|t|)
## (Intercept) 21.95597    0.06792   323.3   <2e-16 ***
## depth       -1.94621    0.01174  -165.8   <2e-16 ***
## ---
```

```
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 3.835 on 9726 degrees of freedom
## Multiple R-squared:  0.7387, Adjusted R-squared:  0.7387
## F-statistic: 2.75e+04 on 1 and 9726 DF,  p-value: < 2.2e-16
```

8. Interpret your model results in words. Include how much of the variability in temperature is explained by changes in depth, the degrees of freedom on which this finding is based, and the statistical significance of the result. Also mention how much temperature is predicted to change for every 1m change in depth.

   Answer: The residuals of our linear regression model range from -9.5173 to 13.5834. We can observe a very low p-value (< 0). Hence, we reject our null hypothesis and accept our alternate hypothesis that Mean Lake temperature recorded during July changes with depth across all lakes. 73.8% of the variability in temperature is explained by the changes in depth. We obtained a residual standard error of 3.835 on 9726 degrees of freedom. With every 1m increase in depth, temperature decreases by -1.95 C.

Multiple regression

Let's tackle a similar question from a different approach. Here, we want to explore what might the best set of predictors for lake temperature in July across the monitoring period at the North Temperate Lakes LTER.

9. Run an AIC to determine what set of explanatory variables (year4, daynum, depth) is best suited to predict temperature.

10. Run a multiple regression on the recommended set of variables.

```r
#9 Running an AIC using the step() function
lmAIC <- lm(data = NTL_wrangled, temperature_C ~ year4 + daynum + depth)
summary(lmAIC)
```

```
##
## Call:
## lm(formula = temperature_C ~ year4 + daynum + depth, data = NTL_wrangled)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -9.6536 -3.0000  0.0902  2.9658 13.6123
##
## Coefficients:
##              Estimate Std. Error  t value Pr(>|t|)
## (Intercept) -8.575564   8.630715   -0.994  0.32044
## year4        0.011345   0.004299    2.639  0.00833 **
## daynum       0.039780   0.004317    9.215  < 2e-16 ***
## depth       -1.946437   0.011683 -166.611  < 2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
```

```
## Residual standard error: 3.817 on 9724 degrees of freedom
## Multiple R-squared:  0.7412, Adjusted R-squared:  0.7411
## F-statistic:  9283 on 3 and 9724 DF,  p-value: < 2.2e-16
```

```r
step(lmAIC)
```

```
## Start:  AIC=26065.53
## temperature_C ~ year4 + daynum + depth
##
##          Df Sum of Sq    RSS   AIC
## <none>                141687 26066

## year4        0.011345   0.004299    2.639  0.00833 **
## daynum       0.039780   0.004317    9.215  < 2e-16 ***
## depth       -1.946437   0.011683 -166.611  < 2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 3.817 on 9724 degrees of freedom
## Multiple R-squared:  0.7412, Adjusted R-squared:  0.7411
## F-statistic:  9283 on 3 and 9724 DF,  p-value: < 2.2e-16
```

11. What is the final set of explanatory variables that the AIC method suggests we use to predict temperature in our multiple regression? How much of the observed variance does this model explain? Is this an improvement over the model using only depth as the explanatory variable?

Answer: The final set of explanatory variables that the AIC method suggests to predict temperature are years (year4), number of days (daynum) and depth. The model explains 74.1% of the variability. However, the model using only depth as the explanatory variable explained 73.8% of the variability in the model. Hence, the multiple regression model is not an improvement over the linear regression model where depth was defined as the explanatory variable.

Analysis of Variance

12. Now we want to see whether the different lakes have, on average, different temperatures in the month of July. Run an ANOVA test to complete this analysis. (No need to test assumptions of normality or similar variances.) Create two sets of models: one expressed as an ANOVA models and another expressed as a linear model (as done in our lessons).

```
#12 Running a one-way ANOVA to see whether the different lakes have, on average,
#different temperatures in the month of July

LakeTempAnova <- aov(data = NTL_wrangled, temperature_C ~ lakename)
summary(LakeTempAnova)
```

```
##               Df Sum Sq Mean Sq F value Pr(>F)
## lakename       8  21642  2705.2      50 <2e-16 ***
## Residuals   9719 525813    54.1
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

```
LakeTemplm <- lm(data = NTL_wrangled, temperature_C ~ lakename)
summary(LakeTemplm)
```

```
##
## Call:
## lm(formula = temperature_C ~ lakename, data = NTL_wrangled)
##
## Residuals:
##     Min      1Q  Median      3Q     Max

```
##
## Residual standard error: 7.355 on 9719 degrees of freedom
## Multiple R-squared:  0.03953,    Adjusted R-squared:  0.03874
## F-statistic:    50 on 8 and 9719 DF,  p-value: < 2.2e-16
```

13. Is there a significant difference in mean temperature among the lakes? Report your findings.

    Answer: Yes, there is a significant difference in mean temperature among the lakes. This is because the p-value obtained from our anova is < 0.05. Hence, we reject the null hypothesis that the means of temperature are same across all lakes

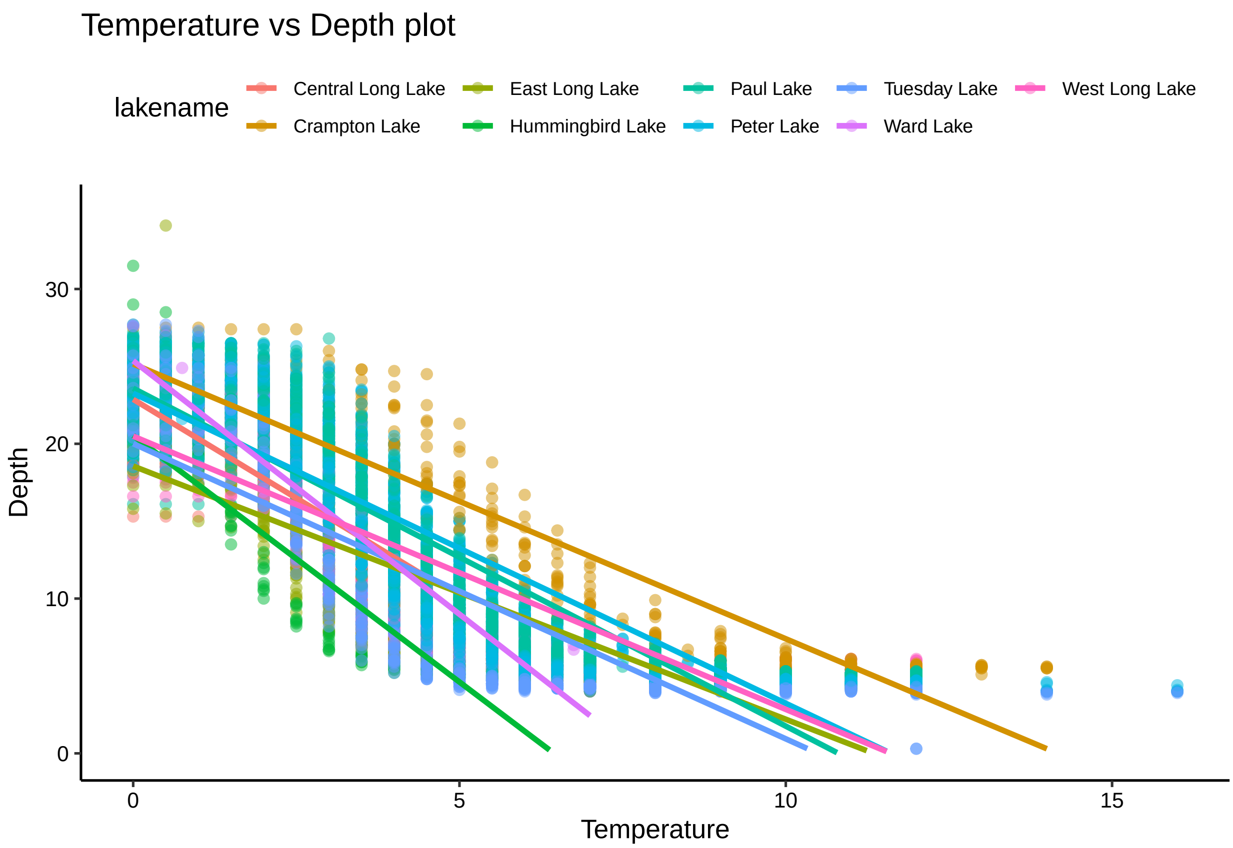
14. Create a graph that depicts temperature by depth, with a separate color for each lake. Add a geom_smooth (method = "lm", se = FALSE) for each lake. Make your points 50 % transparent. Adjust your y axis limits to go from 0 to 35 degrees. Clean up your graph to make it pretty.

```r
#14. Creating a temperature by depth plot with a seperate color for each lake and
#a seperate regression line for each lake

TemperatureByDepth_Plot2 <- ggplot(NTL_wrangled,
                                  aes(x = depth, y = temperature_C, color = lakename))  +
  geom_point(alpha = 0.5) +
  geom_smooth(method = lm, se = FALSE) +
  ylim(0, 35) +
  ylab(expression("Depth")) +
  xlab(expression("Temperature")) +
  ggtitle("Temperature vs Depth plot") +
  mytheme
print(TemperatureByDepth_Plot2)
```

```
## `geom_smooth()` using formula 'y ~ x'
```

```
## Warning: Removed 73 rows containing missing values (geom_smooth).
```



15. Use the Tukey's HSD test to determine which lakes have different means.

```
#15 Tukey HSD test

TukeyHSD(LakeTempAnova)
```

```
##   Tukey multiple comparisons of means
##     95% family-wise confidence level
##
## Fit: aov(formula = temperature_C ~ lakename, data = NTL_wrangled)
##
## $lakename
##                                       diff        lwr        upr     p adj

16.From the findings above, which lakes have the same mean temperature, statistically speaking, as Peter Lake? Does any lake have a mean temperature that is statistically distinct from all the other lakes?

> Answer: Ward and Paul Lakes have the same mean as Peter Lake. No lake has a mean temperature that is statistically distinct from all the other lakes.

17. If we were just looking at Peter Lake and Paul Lake. What's another test we might explore to see whether they have distinct mean temperatures?

> Answer: We can use the two sample t-test to see whether Paul and Peter Lakes have distinct mean temperatures.
